Note: Lock can be mounted on inset or overlay doors.

1. Locate and mount lock as indicated. Lock can be centered or offset vertically on the door as desired. Without altering the rod length the lock assembly requires 81" inside cabinet for installation.

2. Once lock is mounted, mount the hook assembly to the door to establish the rod length. To do this measure from the edge of the lock (as indicated) to the leading edge of the hook assembly (as indicated) then add 1¼". This is your rod length for that half of the locking assembly. Cut rod to length if needed. Repeat this procedure for the other rod.

3. Dismount the hook assembly. Slide one or two rod supports onto the rod (depending on your rod length), slide hook assembly onto the rod, insert the rod into the lock and re-mount the hook assembly. Evenly space the rod supports and mount. Repeat this procedure for the other rod.

4. Locate locking pin location for both the top and bottom of the cabinet and screw into place.
