Installation

1. Locate and mark corresponding centers on both the fall flap/door and cabinet shelf. **Fig. 1.**

2. At these points, measure back from the edge 13mm to locate the center of the 35mm holes for hinge cups.

3. Once the centers have been determined, drill 35mm holes 12mm deep. For this operation, we suggest a drill press or a handheld drill with an attachment like the Rockler JIG IT Drill Guide (91981, sold separately) to ensure accuracy. **Fig. 2.**

4. For ease of installation, loosen the larger of the two adjustment screws to separate the hinge. Install the hinge parts into the 35mm holes using the provided screws. Make sure that the section with the arm is installed on the fall flap/door.

5. Once the hinge sections are installed, reconnect them. Tighten the large adjustment screw to lock in place. **Fig. 3.**

Adjustment

To adjust the fall flap/door from side to side, loosen the large adjustment screw and move to the desired location. Then tighten the adjustment screw. To adjust the fall flap in and out, loosen the large adjustment screw, move the fall flap to the proper position and tighten the screw. To raise or lower the fall flap/door, loosen the large adjustment screw one turn, then turn the small adjustment screw (clockwise to raise it or counterclockwise to lower it). Tighten the large adjustment screw.
