1. Determine the height at which you want to mount the lock. It can be centered vertically on the door or offset as desired. Use the reference dimensions shown to mark the keyhole location and carefully cut the keyhole. (Keyhole escutcheon not included.)

   **Note:** To accommodate the full rod length, the assembly requires an 81" inside cabinet height. Otherwise, the rod will need to be cut.

2. Mount the lock to the door as indicated.

3. Mount the hook assembly to the door to establish the rod length. To do this, measure from the edge of the lock to the leading edge of the hook assembly and add 1\(\frac{3}{16}\)". This is the rod length for that half of the locking assembly. Cut rod to length if needed. Repeat this process for the other rod.

4. Dismount the hook assembly. Slide one or two rod supports onto the rod (depending on rod length), slide hook assembly onto the rod, insert the rod into the lock and re-mount the hook assembly. Evenly space the rod supports and mount. Repeat for other rod.

4. Locate locking pin location for both the top and bottom of the cabinet and screw into place.
